5a. The Wow! Interface - CC Edition

Equalizer Sliders

Wow! has five sliders. Moving them upward or downward will add contrast or soften the image.
Left to right:
1. High frequencies: with positive values, affects the thin details similarly to a classic 100.1.0 USM; the opposite with negative.
2. High/medium frequencies. Affects a bit larger areas. Often used as the first slider with negative values to soften the image.
3. Medium frequencies. Plays and important role sharpening, but more softening.
4. Medium low frequencies. Strongly affects the overall effect. Because of its structure it's mostly used in positive.
5. Low frequencies. Affects the largest areas. Often used with negative values to reduce the blacks depth.
6. Opacity slider. Used to reduce the effect if you are working of the background layer.
By default it is set at 100%.

Pull this small handle to reveal more presets.

Other Buttons

The "Home" button links to Wow! homepage. The "Preferences" button open the prefs window. The "?" button displays the version release. Press "resetl" to reset the sliders to 0.

Live Preview On and Off

According to your work habits, file size and CPU performance you can set the live view on or off using the preference button.
By default the live preview is set on off.

Live Preview Off Mode

Wow! opens with the sliders set to 0.
Once entered your custom values or selected a preset, press the RUN button to start Wow! and get the full screen preview.
The preview is progressive. This means that if you change the values and RUN again, the new version will replace the previous.
Press the button ON to see the before/after.

Live Preview On Mode

Setting the preference to "live view" Wow! will update the preview any time you will move the sliders.

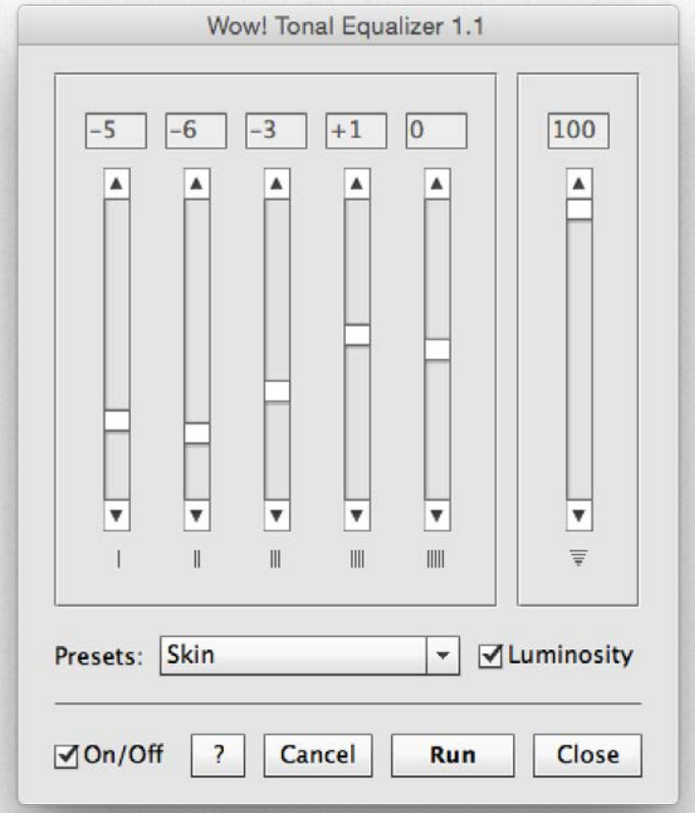
Presets

You can try six presets: Wow, Gentle, Skin, Enhanced Black Controls Product, or Boost. designed for an average file size as Wow! is file size sensitive. This means that if you apply it to a 4000px wide file or to a 1000px one, the result will be very different.
Read the preset section for more info.

5b. The Wow! Interface - CS6 Edition

Equalizer Sliders

Wow! has five sliders. Moving them upward or downward will add contrast or soften the image.
Left to right:
1. High frequencies: with positive values, affects the thin details similarly to a classic 100.1.0 USM; the opposite with negative.
2. High/medium frequencies. Affects a bit larger areas. Often used as the first slider with negative values to soften the image.
3. Medium frequencies. Plays and important role sharpening, but more softening.
4. Medium low frequencies. Strongly affects the overall effect. Because of its structure it's mostly used in positive.
5. Low frequencies. Affects the largest areas. Often used with negative values to reduce the blacks depth.
6. Opacity slider. Used to reduce the effect if you are working of the background layer.
By default it is set at 100%.



Presets

You can try six presets: Wow, Gentle, Skin, Enhanced Black Controls Product, or Boost.. Please read the preset section to get more info.

Preview

Wow! opens will all the sliders set to 0.
Once entered your custom values or select a preset, press the RUN button to perform Wow! and get the full screen preview.
If you change the values an RUN again, the previous version will replaced by the new one.
Press the button ON to see the before/after.

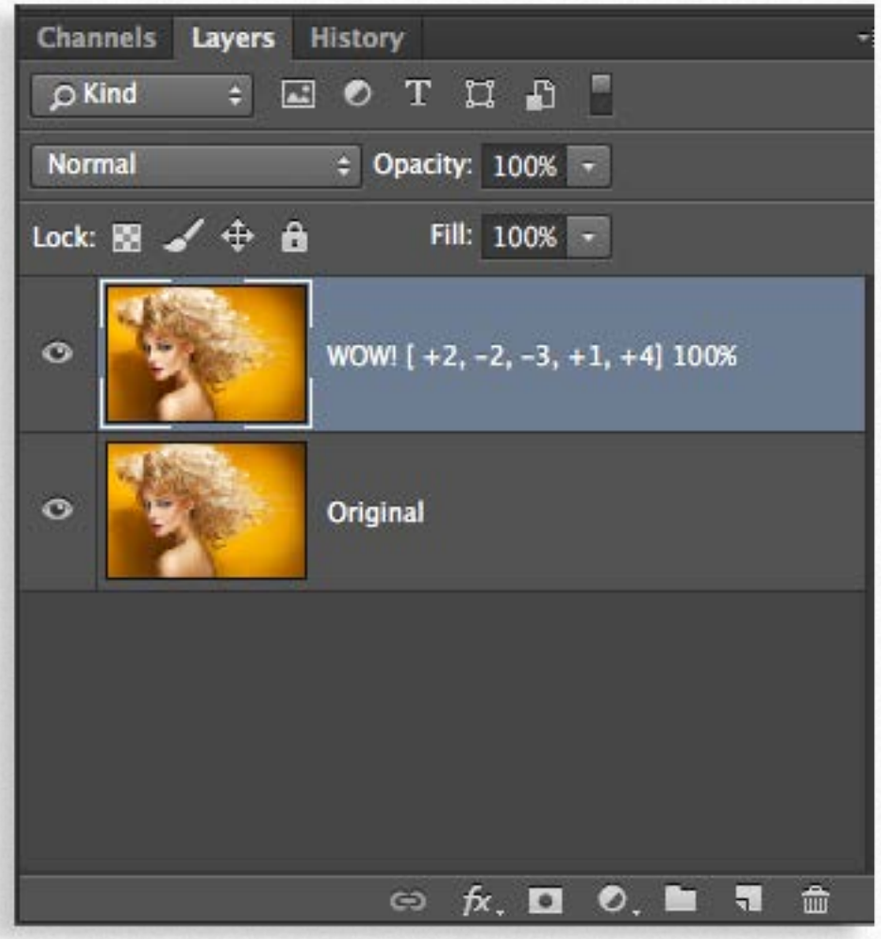
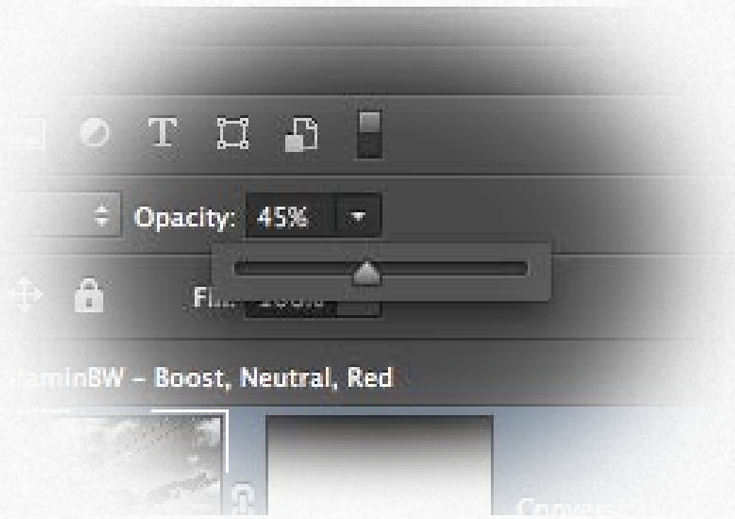
Close Wow!

6a. Use Wow! in Standard Mode (Live Preview off)

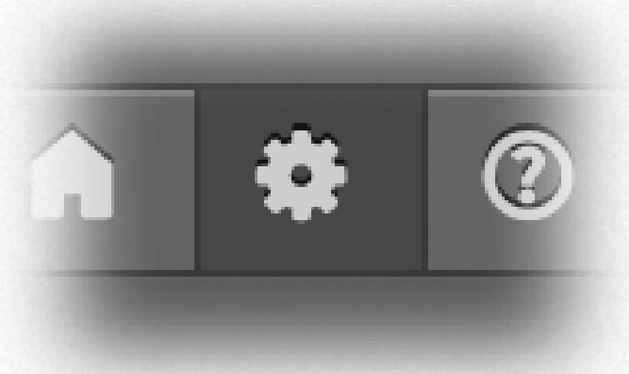


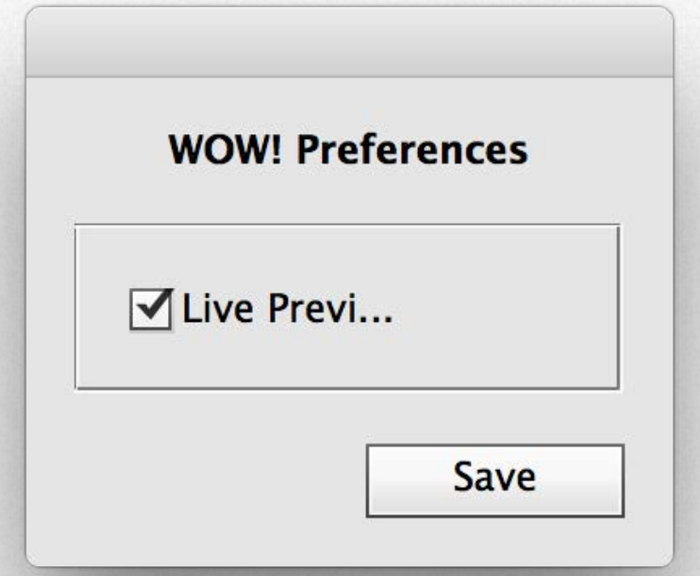
To apply Wow! choose a preset or enter your custom values then press RUN.
Inspect the result and if necessary tweak some sliders and RUN again. Wow! will be applied on the original layer.
If you like the result but the effect is too strong you can reduce the opacity value with the slider on the right of the panel and run again. This make sense if you are working directly on the background. However we suggest that you work on a duplicate layer as shown on the left.
In this case Wow! was set at 100% opacity. Eventually we rwill tweak the effect later by adjusting the opacity of the layer as shown on the left.



Tip: You can reduce the strength of the contrast by reducing or increasing opacity. You can do this only if you apply Wow! on a duplicate layer.

6b. Use Wow! in Live Preview Mode (Not available in CS6)





A New Faster Algorithm

Now Wow! is approximately three times faster than the previous version and you can prefer to work with the live preview. This means that any time you move the slider the preview is updated.

To enable Live Preview press the preferences tab, check “Live Preview” and save.

The Run Tab is now inactive.

7. How to get the most out of Wow! Tonal Equalizer

We strongly recommend you start using Wow! as described below.
Step1. Carefully read this manual.
Step2. Use some of your standard files as a test.
Step3. Apply Wow! using the presets.
Step4. Duplicate the background layers changing some sliders, especially the 1, 4 and 5 and compare them.
Step5. Apply the same values on the same original at different sizes to understand how the file size may affect the result.
Well! At this point you will be ready to explore all the potentials of Wow!

Tips: a recommendation about the export of your color files. Don't push contrast, clarity and USM. Wow! will manage all this parameters. Wow! will do it better.

8. The Equalizer

Similarly to music equalizer, Wow! allows you to control the tonal values, sharpness and local contrast of your file, working on the higher (finest details), medium or low, (large areas) frequencies.
You can modify positive or negative values. Use positive (upward) to add sharpness (with higher frequencies) or boost the local contrast (with lower frequencies). Use negative values moving the sliders downward. This will soften the image with a very pleasant result.
Wow! performs its best when mixing positive and negative values, adding a very personal and powerful look to your images, whether the subject is a person, a landscape or a product.

From left to right. The sliders set to 0, then the four preset: Wow, Gentle, Enhanced with Black Control and Boost

In the next two pages you can see the comparison between the sliders sets at +10 or -10. The upper row illustrates the difference between the original layer and the Wow! one. The lower row the Wow! layers.
The first page deals with positive, the second with negative. As you can see the slider on the left acts on the finer details. Proceeding to the right the affected areas become progressively larger.

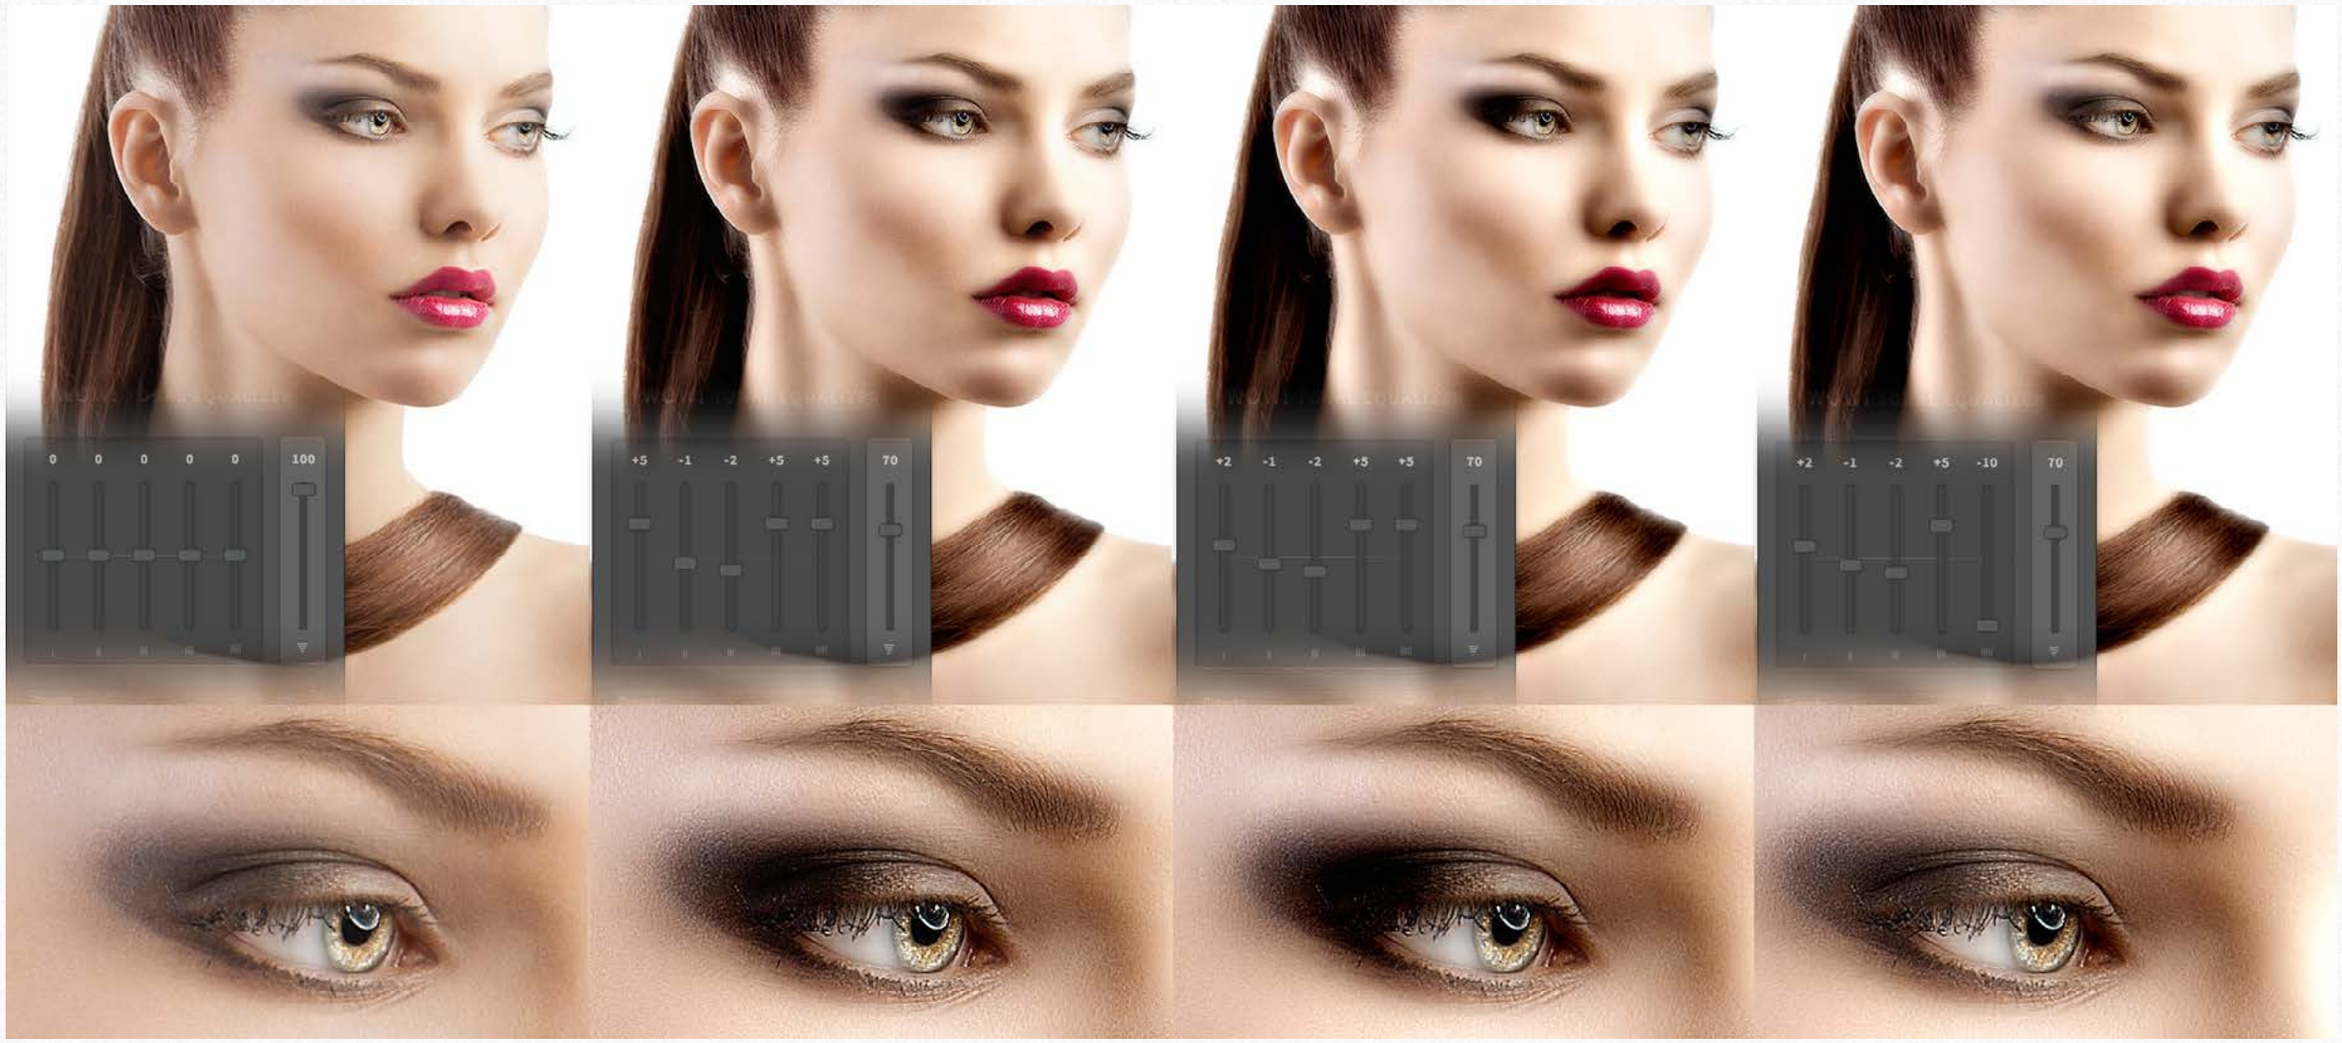
Wow! delivers a high quality full screen live view preview, that remains temporary until you proceed to the next history state.
You can apply a preset or your custom values, check the result, tweak the sliders and run again. Wow will delete the previous version and apply the new one. Each time the layer will be renamed with the used values; for example: WOW! [+1, 0, 0, +3, +6] 100%.
By default Wow! is applied on the background. We strongly suggest you duplicate the background, work on it and compare the two or more versions, blend two versions using opacity or add a blank (white) mask on the Wow! layer and remove unwanted parts.



From left to right. 1. Original (lack of detail, a bit noisy and flat overall rendition) . 2. WOW! [+5, -1, -2, +5, +5] 70% too grainy and noisy. 3. same than previous but +2 instead of +5 to the first slider (affecting sharpening detail). 4. Last but not least, the blacks are too deep. There are many options to correct this. Here I placed the fifth slider to -10, add a black mask to recover the blacks detail. Or use WOW! [+5, -1, -2, +5, -5] to open all the blacks.

9. Wow! is file size sensitive

In the next chapter we will approach using presets. Before starting it is important to understand that they are only a starting point and may vary in an impressive way with different subjects and at different file size. Below you can see a comparison with the same values applied at 1000px or 3000px. The sliders were set in both versions at +2, -2, -3, +3, +4. In this case the result with the larger file is much more interesting but, in other cases maybe the opposite. So to get the best from your file apply Wow! only to the final, intended use, file size.

10. Quick and clean: frequency separation according to Wow!

This next pages explains how Wow! works. Like our other tools, Wow! gives you an often excellent starting point simply by picking a preset. You can tweak it at will to reach what is optimal for you. If you need more control, keep Wow! on a separate layer and play with opacity and layer masks. The process is quick: in a couple of minutes, we were able to obtain five different versions.
To compare the versions like in Photoshop layers please watch the pdf at full page and go back and forth using the keyboard left/right keys.

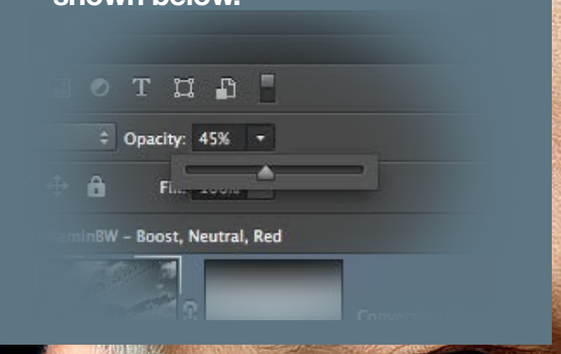
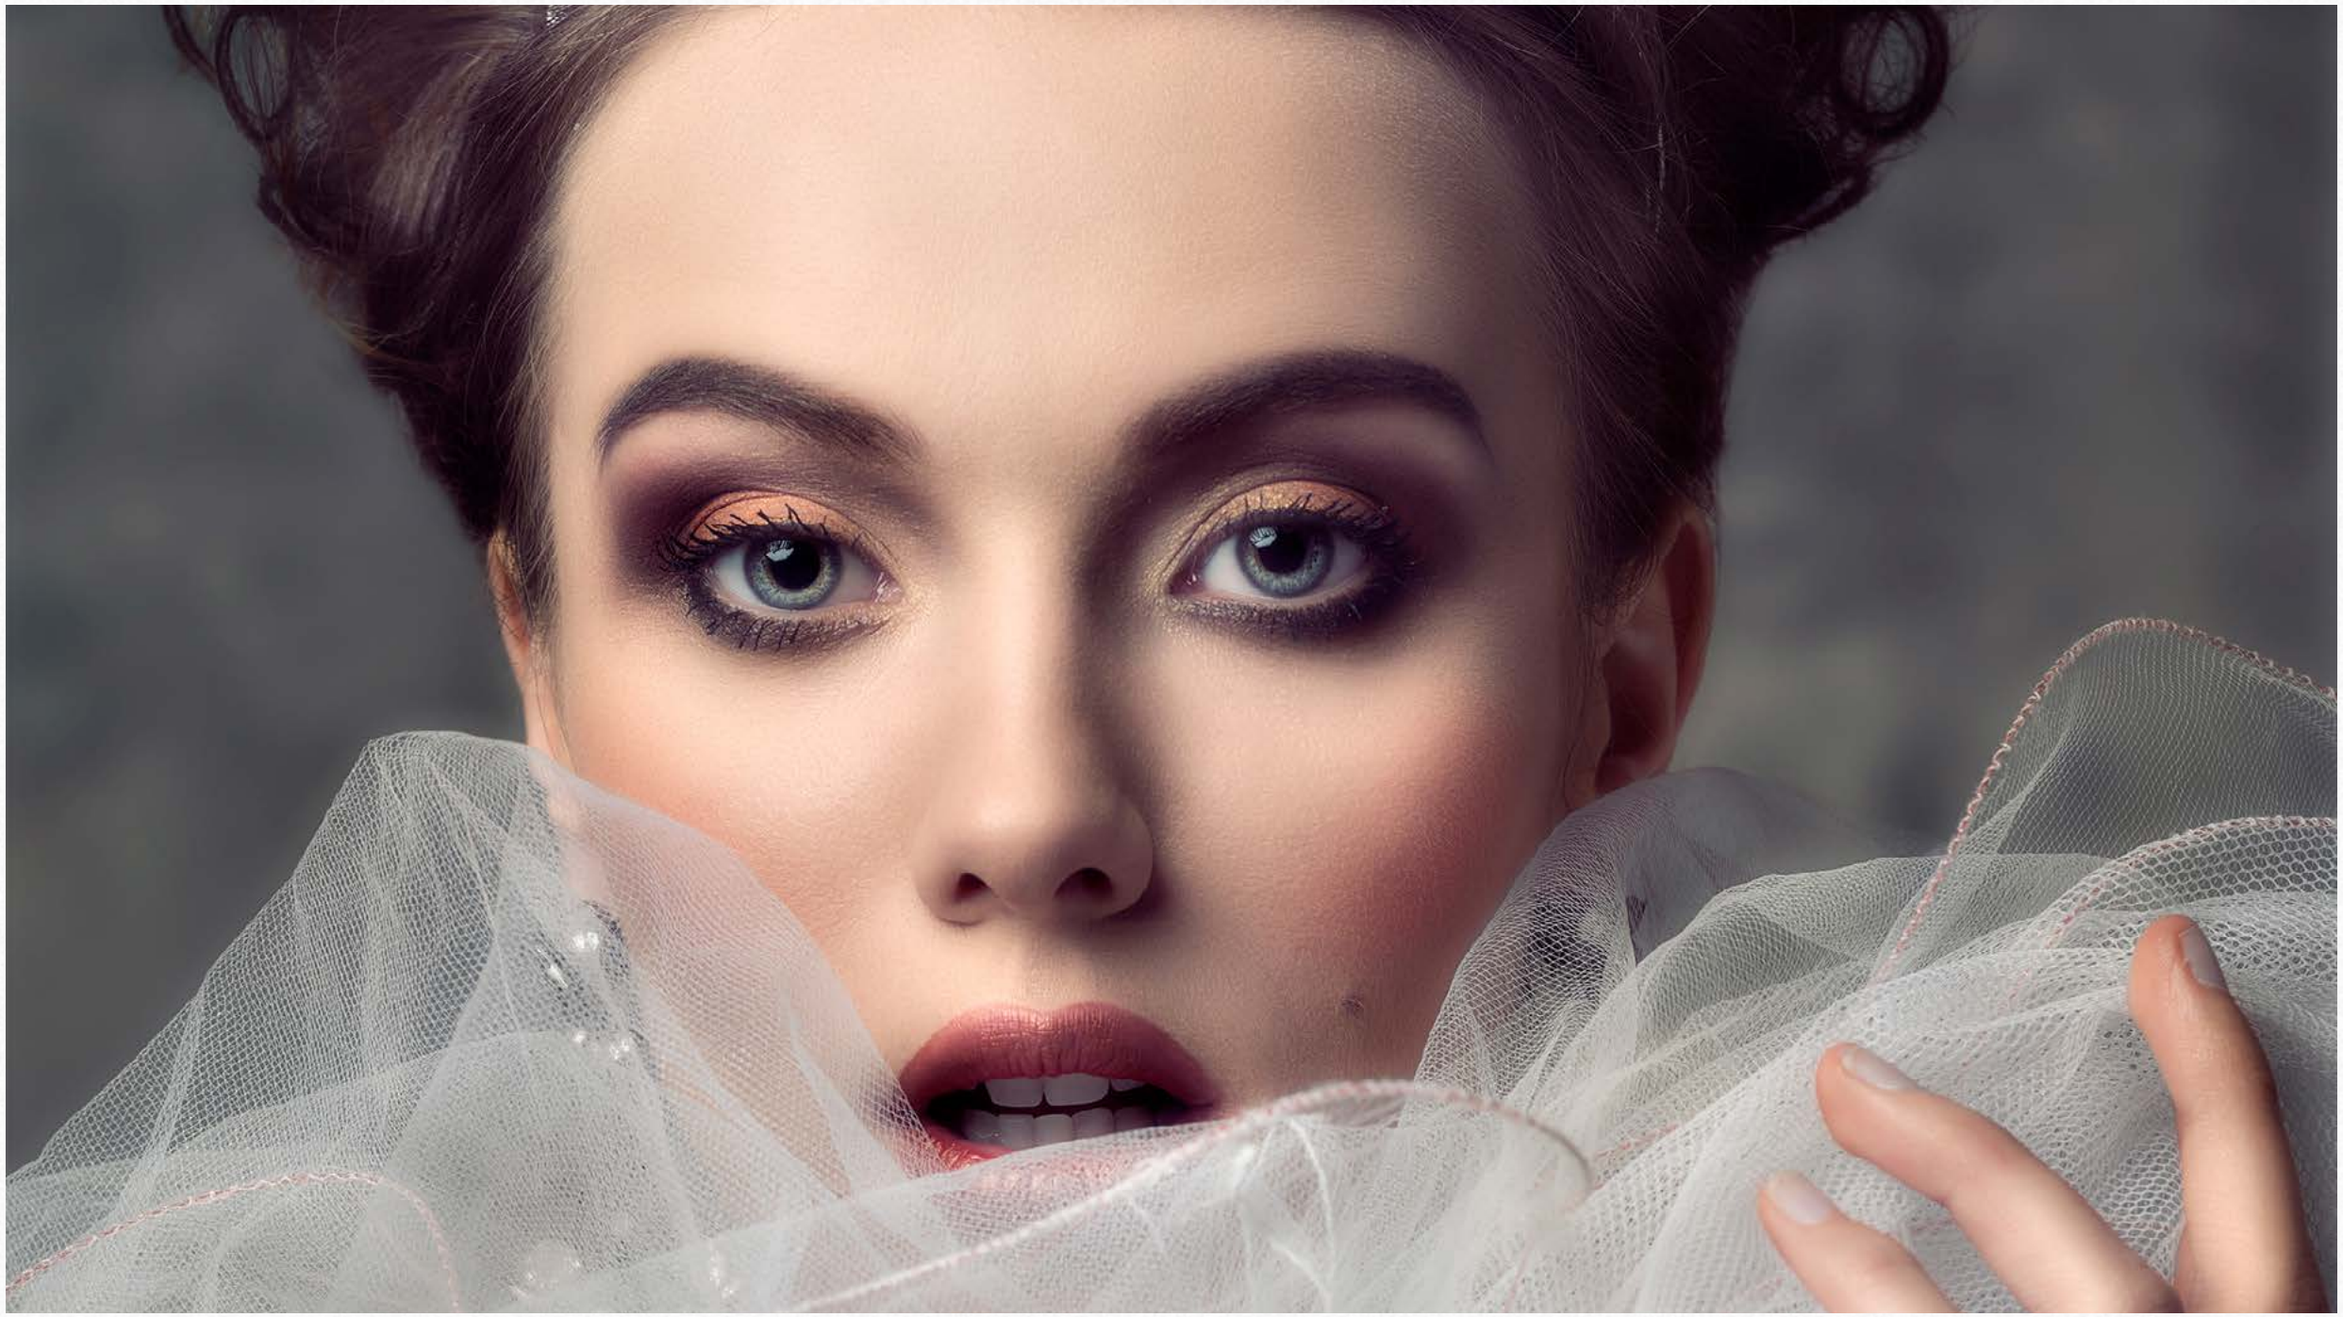
Don’t worry if the effect is too strong. Simply play with opacity adjusting the opacity slider.

For a full control we suggest to apply Wow! on a duplicate layer and change opacity slider as shown below.



11. The “Wow Factor”

Any image is made of fine detail and coarser areas. Controlling these independently is the key to the winning look which has “The Wow! Factor”. How does it work? In the unique Wow! panel, through five dedicated sliders whose values can be either positive or negative you can control separately sharpening, shape and smoothening. Start with one of our presets, and tweak the sliders to reach what is optimal for you. If you need more control, keep Wow! on a separate layer and play with opacity and layer masks.



12. The Presets

The new Wow! embeds six new presets designed to meet different requiremets. The values are optimized for a mid-size file. Let's say from 3000 to 4500px wide and must be considered a starting point. Some of the them, i.e. Wow!, are designed for a straight application, others to be sand-witched. For instance a fantastic combination is Skin+Wow. We strongly invite you to test all the presets with different subjects and play with the sliders. Don't forget to play with the opacity. An effect too harsh at 100% may be perfect at 70%.

Wow!

[+2, -2, -3, +1, +4] 100%

It's the basic preset. Simply apply it and often you will get immediately what we call "The Wow! Factor",the magic combination of sharpening and smoothing that helps you add shape and personality to your images.

It's the perfect companion of "Skin".

Gentle

[+2, -1, -2, -3, +6] 100%

Tipically to be applied at the end of your workflow. It improves the tonal transitions end enhance all details. Great for beauty and portrait in general.

Skin

[-5, -6, -3, +1, 0] 100%

It's the smoothing preset, great to correct skin imperfections. You can apply Skin on a first layer and Wow! on a second, add a white mask, grab a soft black brush and reveal all the parts that need to be corrected. A great powerful combination

Enhanced Black Control

[+2, -1, -2, +5, -2] 100%

Add a powerful mood to your images. Increase the fourth slider value to enhance the effect, decrease the fifth value to control the black detail.

Pushing the layers values and deforming the image you can get incredible caricature effects.

Product

[+3, +3, -2, 0, 0] 100%

A very versatile preset. We could have called it "Lanscape" "Birdwatching" or "Automotive". Similar to an high frequency HiRaLoam effect but much more versatile.

Boost

[+2, 0, 0, +3, +6] 100%

Add power to your image. Reduce the fifth layer value con add detail to the blacks. Try to add a mask to reduce some parts and eventually play with opacity to reduce artifacts.

13. Case History 1&2. Add an exclusive look to an already good image.

Wow may add a magic exclusive look to many images. We call this “the Wow! factor”
We applied Wow to two images already good. In both cases we used the preset “Wow”: [+2, -2, -3, +1, +4] 100%

Know-How Transfer – The Photography Knowledge Hub

A new platform by the same team who developed ALCE, formerly RBG Group or Bigano and associates.

Everyone dealing with photography and digital imaging will find a unique mix of instructional and how-to content here. We offer applications specifically designed by photographers for photographers, as well as effective tutorials and free resources. Our mission is to create a community, a Central Hub of Photography Knowledge, where photographers can exchange experiences, share information and grow their skills. Read more about our team here >

Many of them come from the school of the great Dan Margulis and still have a very special relationship with him.
I'm pleased to report here what he wrote about this group taken from his famous post "La Dolce Vita - An era ends":

*They say that Italians get emotional at times like this, and that Italians love beautiful things. I admit to feeling a bit Italian myself as I write this. I *have* developed an emotional attachment to the country, no doubt. And the relationships I have entered into with several of my students in that country have evolved into something, well, profoundly loving. The old joke has it that in heaven, all lovers are Italian. Right off-hand I can think of a couple of exceptions to this generality, but there is no need to go off-topic. The truth is that it is a land of love and great beauty, made all the more beautiful professionally by seeing the new and sophisticated imaging algorithms being developed by Davide with Marco Olivotto, and by seeing how Alessandro, Daniele Di Stanio, Tiziano Fruet and others have brought first-class color instruction into a country where it was rarely found previously.*
